Dear Customers:

Thank you for choosing BAOFENG two-way radio. BAOFENG always provides customers with wireless communication products of high performance and stability, and this two-way radio is no exception. DM-5R is a manually adjustable, all-weather digital two-way radio with 128 channels, lattice LCD, English and Chinese voice prompts developed and produced by the BAOFENG team for civilian use. Please read this instruction manual carefully to get a full understanding of this radio’s superior performance, as well as its operation and maintenance methods.

Functions

Characterized by attractive appearance, solidness, durability, loud voice, excellent performance, perfection and value, this two-way radio is manually adjustable, all-weather digital two-way radio with 128 channels, lattice LCD, English and Chinese voice prompts. Other functions include:

- DMR compatibility, digital and analog; lattice LCD display; English and Chinese voice prompts; friendly interface
- Digital talkback function: supports individual call, group call and all call and supports digital voice encryption
- Supports use of relay in digital mode
- Supports two-way radio detection in digital mode
- Supports emergency alarm in digital mode
- Dual-stage, dual-display and dual-frequency waiting, relay cross-stage receiving and transmitting in U/V stage, easy networking for users
- Frequency range: VHF130-176MHz & UHF400-520MHz
- High Power/Low power: Different power levels for different distances means energy and power saving
- Up to 128 memory channels available for the programming of frequency and other various data
- LCD display shows channel number, frequency, channel frequency and channel name, etc
- Different CTCSS/DCS and DTMF signaling can be set for each channel, to reject surplus calls from other radio stations
- Tail tone elimination: eliminates the impact noise made by the speaker after the call
- VOX Function: allows users to operate the two-way radio without using hands and to have a normal conversation without pressing the PTT key
- Emergency alarm and ANI identification through DTMF
- DTMF, CTCSS (60.0 - 259.9 HZ) and DCS signaling coding and decoding function
- 8-level stepped frequency selection (2.5K, 5.0K, 6.25K, 10.0K, 12.5K, 20.0K, 25.0K and 50.0K)
- Intermediate pilot frequency and reverse frequency functions allow adaptation to the setting requirements of various complex conditions
- Auto power saving function: reduces power consumption to extend the operation time of the two-way radio
- Emergency call, sound and light alarm function
- Computer programmable: frequency and function setting
- Broad/narrow band (25KHz/12.5KHz) selection
- Digital tunable FM radio (receiving frequency: 65-108MHz)
- Direct selection of menu items with numeric characters on the keyboard. The transmitting and receiving frequency can be entered directly.
- Bright flashlight lighting function
- Battery voltage display

User safety information

Please read the following information for the safe and efficient operation of this two-way radio.

1. Maintenance of this two-way radio can be done only by professionals. Please do not attempt to disassemble this radio without professional training or experience;
2. To avoid problems caused by electromagnetic interference and/or electromagnetic compatibility, please turn off the two-way radio at places with the "please turn off the two-way radio" sign, such as hospital and other health care and medical treatment places.
3. Please turn off the two-way radio when you are on a flight if so required by crew members.
4. In cars with airbags, don't place the two-way radio in an area where the airbag may stretch when it is deployed.
5. Please turn off the two-way radio before you enter into a flammable or explosive environment;
6. Don't replace or charge the battery in a flammable and explosive environment;
7. Please turn off the two-way radio before you come close to blast zone and areas where a detonator is arranged;
8. Don't use the two-way radio with a broken antenna. A slight burn may be caused when the broken antenna is brought into contact with the skin.
9. Don't expose the two-way radio to direct sunlight for a long time or place it near a heating device.
10. When a portable two-way radio is transmitting signal, place it vertically, and keep the microphone about 5cm away from mouth.
11. When transmitting signal, keep the antenna of the two-way radio 2.5cm at least away from head or body.
12. If you wear the portable two-way radio, it should be confirmed that when the two-way radio is transmitting signal, its antenna is kept 2.5cm at least away from body.

Product check

Enjoy your BAOFEENG DM-5R wireless digital two-way radio. Before use, it is suggested that you:
1. First check whether the packing box of this product shows sign of damage;
2. Open the packing box carefully and confirm it contains the contents listed in the table below; Please contact the dealer immediately if you find this product or any accessory is lost or damaged during handling.

**List of accessories**

**Battery information**

**• Using the battery for the first time**

Please fully charge the new battery before use, as it was not fully charged upon delivery. Generally, when the battery is used for the first time, it should be charged for 4 hours. For a lithium ion battery, whether you are using a normal charger or a rapid charger, 4 hours charging time should be followed. We suggest that you charge your battery this way for the first 3 charging cycles. When the battery runs low, it should be charged.

**• Battery Types**

Please ONLY charge BAOFENG batteries; an explosion may occur and cause personal injury if other batteries are used on the charger.

**• Battery Use Safety**

1. Don't bring the battery contacts or poles into contact with metal objects (including coins, key, jewelry or other conductive metals), otherwise short circuiting, discharging, heating or leakage may occur and cause item damage or personal injury. Likewise, care must be taken when disposing of the battery.

2. Don’t cause a short circuit of battery terminals or discard the battery into fire. Don’t disassemble the shell of the battery pack by yourself. Please put the discarded battery into dedicated battery recycling bins.

**• Battery Operation**

Please charge the battery indoors and at room temperature for optimal charging.

★ In general, the battery is fully charged when the indicator of the charger turns from red to green. When fully charged, the battery should be removed from the charging station.

★ The battery can be charged while attached to the radio. For optimal charging, make sure the radio is turned off while charging.

★ In order to maintain maximum battery capacity, don’t charge the battery until the battery is completely out of power. (When the power is exhausted, the two-way radio will send out voice warning).

★ Continuing to charge a fully charged battery will reduce battery capacity and battery life.

**• Extend the service life of the battery**

★ Battery performance will decrease at temperature below -20 °C. It is best to prepare a spare, back-up battery to use in cold weather. Don’t discard cold batteries which fail to work. They may work again at room temperature.

★ Dirt deposited on the battery contacts may affect the service life of the battery. Please wipe the contacts with a clean dry cloth before the battery is loaded onto the two-way radio.

**• Battery storage notes**

1. Since battery self-discharge may occur, please fully charge the battery before long-term storage to avoid damage to the battery due to over-discharge.

2. Please take the battery out of storage and recharge it every 6 months to avoid over-discharge which will affect the battery’s capacity.

3. Pay attention to the temperature and humidity of the battery storage environment. Please store the battery in cool and dry conditions and at room temperature to reduce battery self-discharge and maintain maximum battery life.

If the red indicator light on the two-way radio flashes after the battery is loaded, and voice prompts "low battery" every 30 seconds, please charge the battery.

Please ONLY charge the battery with a BAOFENG-specified charger; the indicator on the charger indicates the charging condition.

<td>Red light flashes</td>
<td>Low battery voltage</td>
</tr>
<tr>
<td>Red light is on</td>
<td>In charging process</td>
</tr>
<tr>
<td>Green light is on</td>
<td>Charging completed</td>
</tr>
</tbody>
</table>

• Charge the radio as follows

1. Insert the power cord into power adapter;
2. Insert the DC plug on the power adaptor into the DC jack on the back of the charger;
3. Insert the battery or the two-way radio with battery on the charger;
4. Insert the AC plug of the power adaptor on the output socket of AC power supply.
5. Confirm that the battery is brought into contact with the charge terminal. When the indicator turns red, charging begins.
6. After the battery has been charged for about 4 hours, the indicator turns green, meaning the charging is complete. Now, the battery or the two-way radio with the battery can be taken out.

Note: Make sure that this product is turned off during charging. The red light may flash continuously when the battery is put into the charger. This is the pre-charge process of the charger for protecting the battery when the battery power is low. It is normal, and usually lasts for 30 seconds. Once this process has completed, the red light turns on and the battery begins to charge normally.

• Accessory installation
  1. Battery installation/removal
  2. Battery installation

Align the battery with the battery seat on the back of the two-way radio. Press the battery into the two-way radio forcefully, slide the battery upward until the locking plate clicks in and is locked in a proper position. (As shown in Figure 1-1)

• Battery removal

Turn off the two-way radio before removing the battery. Move the battery lock to the unlocking position and press, then slide the battery downward until it is taken out of the battery seat. (As shown in Figure 1-2)

2. Antenna installation/removal

Turn off the two-way radio, insert the antenna into the mounting hole and rotate it clockwise. (As shown in Figure 2-1)
For antenna removal, rotate the antenna counterclockwise and remove it. (As shown in Figure 2-2)

3. Belt clip installation/removal

Remove the two screws at the top of the battery. Align the two screw holes of the belt clip with the screw holes at the top of the battery, install the belt clip and tighten the screws (As shown in Figure 3)
Loosen the screws and remove them from the belt clip (It is suggested that you reinstall the screws onto the battery for storage and convenience next time you want to use the belt clip).
4. Installation of external headphone/microphone (Optional accessories purchased separately)

Open the headphone cover and insert the headphone plug into the headphone jack. When not using the headphone, remove the headphone plug from the headphone jack and close the headphone cover. When the general interface isn’t used, please close the dust cover. (As shown in Figure 4)

**[A/B] key**  
In standby mode, switch A/B pointer by pressing this key

**[BAND] key**  
Key for UHF/VHF frequency bank switching; in radio mode, switch 65-75/76-108MHz frequency band by pressing this key

**0-9 numeric keys**  
0—9 numeric keys for frequency, channel sequence number, menu item and menu value input. In menu setting mode, the menu item name behind each numeric key can be set by pressing the key directly.

**Microphone**  
Voice input; keep the microphone about 3—5 cm away from the mouth when transmitting.

**Battery pack**  
Supply power for the two-way radio.

**Battery charging contacts**  
Contact piece between the battery and the charging dock. Don’t bring battery contacts or poles into contact with metal objects.

**Battery push-button**  
Used for battery fixing.

**Loudspeaker**  
Voice output

**Belt clip**  
Used for clipping the two-way radio on the belt for easy carrying.

**[MENU] key**  
Press this key to enter menu setting mode; in menu mode, press this key to enter the current menu item.

**[Δ/\] page up/page down key**  
In frequency mode, change the current receiving frequency up and down from the current set stepped frequency. In channel mode, select channel up and down. In menu mode, change the menu items and menu values to be set forward and backward; search forward and backward rapidly by long pressing this key for more than 2 seconds. In scanning mode, change the scanning direction.

**[EXIT] key**  
In input mode, clear the information that has been input by pressing this key

**[*/SCAN] key**  
Start the frequency or channel scanning by long pressing this key for more than 2 seconds; in FM radio mode, press this key to search FM radio station automatically;

**[#/LOCK] key**  
Switch between high transmitting power and low transmitting power temporarily by pressing this key; lock or unlock the keyboard by pressing this key for more than 2 seconds.

Four kinds of relay audio frequency call signaling: Transmit 1,000HZ signaling by pressing **[PTT] + [CALL] keys**; transmit 1,450HZ signaling by pressing **[PTT] + [VFO/MR] keys**; transmit 1,750HZ signaling by pressing **[PTT] + [A/B] keys**; transmit 2,100HZ signaling by pressing **[PTT] + [BAND] keys**

---

**LCD**

During operation, corresponding function icon shall appear on the display screen. The display screen allows you to realize the meaning of the indicating icon and how to set function with it rapidly.

</tbody>
</table>
Basic operation

- **Startup and shutdown**

  Rotate the [power on/off/volume control] button clockwise until you hear "click" sound, the two-way radio beeps twice loudly, now you can see that the full two-way radio screen lights up immediately and hear the voice prompt that the current operating mode is channel (or frequency) mode. Then frequency and other designators are displayed.

  △ Rotate the same button counterclockwise until you hear "click" sound to turn off the two-way radio.

- **Volume adjustment**

  After turning on the power supply, rotate the [power on/off/volume control] button clockwise to increase the volume gradually.

  △ Rotate the same button counterclockwise to reduce the volume gradually until the power supply is turned off.

- **Talkback (transmitting and receiving)**

  ◇ Call transmitting: After selecting a proper channel (or entering your desired frequency), press [PTT] key, now the two-way radio is in transmitting state. Then speak to the microphone with a normal tone. You can switch the transmitting power according to actual need (power setting is in Menu 2):

  ◇ When transmitting by pressing [PTT] key, display of L at the top of the screen represents that the current transmitting power is low power.

  ◇ When transmitting by pressing [PTT] key, non-display of L at the top of the screen represents that the current transmitting power is high power.

  ◇ Call receiving: After the [PTT] key is released, the two-way radio enters receiving state.

  △ When continuous transmitting time exceeds that specified in "Menu 9" (default 60 seconds), the two-way radio stops transmitting (before transmitting is stopped, the internal time-out timer shall cause the transmitting indicator to flash 10 times in advance, and then voice prompt of "transmitting time out" is issued). In this case, release the [PTT] key to stop transmitting, then press the [PTT] key again to continue the call operation.

  ① To ensure that the two-way radio of the receiver receives the call in best volume, please keep the microphone about 3~5 cm away from the mouth when transmitting.

  ② Communication distance may be shortened by weather conditions and/or surrounding environments. Communication distance may be shorter on rainy days or in the woods.

- **Monitoring function (available for analog channel)**

  In standby mode, press [MONI] key to start monitoring. When squelch circuit is shut off, you will hear the background noise (the prompt tone sounds once); release the same key to stop monitoring, then you will not hear the background noise.

- **Intermediate pilot frequency transmitting (available for analog channel)**

  Transmit 1,750Hz tone pulse signal by pressing [PTT] key first and then pressing [A/B] key; Cancel the transmitting of 1,750Hz tone pulse signal by releasing [A/B] key.

- **DTMF transmitting (available for analog channel)**

  Transmit corresponding DTMF number by pressing [PTT] key first and then pressing corresponding numeric key.
**Frequency/channel mode switching**

When the two-way radio is turned on and the keyboard is not locked, switch to channel mode by pressing [VFO/MR] key. The channel number displayed on the screen. The channel number displayed at the bottom right corner represents that the two-way radio currently is in channel mode. Increase or reduce the channel value by pressing [▲] key or [▼] key. Switch between frequency mode (VFO) and channel mode by repeating this operation. In frequency mode, the channel number is displayed on the screen.

**Frequency selection**

1) VFO mode (frequency mode)

VFO mode is the basic mode for operating frequency changing. Switch to VFO mode by pressing [VFO/MR] key, and increase or reduce the frequency by pressing [▲] key or [▼] key.

2) Enter the frequency directly

Besides pressing [▲] key or [▼] key, you can also enter the frequency directly. If the desired operating frequency is far from current frequency, the frequency can be entered directly through keyboard.

①: Switch to VFO mode by pressing [VFO/MR] key.
②: It’s only the VFO mode that allows to enter the frequency directly.
③: Enter the desired frequency by pressing the numeric keys ([0]~[9]), (three digits before the decimal point represents MHZ, and three digits after the decimal point represents KHZ)

**Single waiting/dual-frequency waiting function switching (available for analog channel)**

In double waiting mode, the two-way radio can receive the frequency set in Channel A or Channel B (achieve the receiving and communication in two frequencies, the UHF/UHF and VHF/VHF). Execute the operation steps below:

1) In analog channel, access the menu by pressing [MENU] key.
2) Press [▲] key or [▼] key (or enter 7 directly) until TDR appears on the screen; enter this option by pressing [MENU] key.
3) Press [▲] key or [▼] key until the pointer on the screen points to ON; then activate the dual-frequency waiting function by pressing [MENU] key.

*or: the pointer on the screen points to OFF; then deactivate the dual-frequency waiting function by pressing [MENU] key.

4) Return to the previous menu.

The dual-frequency waiting function can be activated only when both of Channel A and Channel B are analog channel. If one of them is digital channel, the function can't be activated. For digital channel, the sign 'D' displayed next to the signal strength sign represents that the current channel is digital channel.

**VOX**

After this function is activated, if the speech volume of the user reaches the preset level for the two-way radio, the two-way radio can activate transmitting operation via voice without the [PTT] key being pressed. The function above may be activated in certain workplaces where the user's hands are too occupied to press [PTT] key. Execute the following operations

1) Access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key (or enter 4 directly) until VOX appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key to change current setting according to the screen prompts, then press [MENU] key to select new voice control sensitivity (selection range is 1~10, the greater the value is, the higher the sensitivity is). *or: the pointer on the screen points to OFF; then deactivate the VOX function by pressing [MENU] key.

4) Return to the previous menu.

After the VOX function is activated, the voice can be transmitted by speaking to the microphone; the transmitting shall be stopped by stopping speaking. You can select VOX sensitivity level according to the

**Key locking and unlocking**

In order to prevent unintentional key entering, you can lock the radio's keypad. Execute the operation steps below:

1) Access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key until AUTOLK appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key until the pointer on the screen points to ON; then activate the automatic key locking function by pressing [MENU] key.

*or: the pointer on the screen points to OFF; then deactivate the automatic key locking function by pressing [MENU] key.

4) Return to the previous menu.

After the keyboard locking function is activated, when the keyboard is in the unlocked state, the numerical keyboard shall lock automatically if no keyboard operation is conducted for a period of 8 seconds, and the screen shows the icon. When the keyboard is in locking state, it can be unlocked by pressing [#/=\~] key, and now the icon disappears. After the automatic keyboard locking function is activated, it can be used normally by pressing [PTT]+[MENU], [PTT]+numeric key.
• **Activate or deactivate keyboard sound**

You can activate and deactivate the keyboard sound as necessary. Execute the operation steps below:

1) Access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key (or enter 8 directly) until BEEP appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key until the pointer on the screen points to ON; then activate the keyboard sound by pressing [MENU] key.
   • or: the pointer on the screen points to OFF; then deactivate the keyboard sound by pressing [MENU] key.

4) Return to the previous menu.

• **Squelch level setting (available for analog channel)**

You can adjust the squelch level of the two-way radio; screen out useless calls with weak signal or channels on which the background noise is higher than desired. Execute the operation steps below:

1) Access the menu by pressing [MENU] key.

2) The screen shows and the pointer points to SQL; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key to change current setting, then select new squelch level by pressing [MENU] key.

4) Return to the previous menu.
   • When the squelch level is set as 0 or too low, the two-way radio is easily interrupted by interfering calls with weak signal; when the squelch level is set too high, calls from remote positions may also be screened out.

• **High/low power setting**

You can set the two-way radio power level of each channel as high or low. When it is set as HIGH, you can achieve a longer distance of communication from radio to radio. When it is set as LOW, you can achieve a lower distance of communication from radio to radio. Execute the operation steps below:

1) Access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key (or enter 2 directly) until TXP appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key until the pointer on the screen points to HIGH; then set the two-way radio to high power transmitting mode by pressing [MENU] key.
   • or: the pointer on the screen points to LOW; then set the two-way radio to low power transmitting mode by pressing [MENU] key.

4) Return to the previous menu.
   • In high power mode, switch to low power quickly by pressing [#/] key.

• **Automatic backlight function**

Automatic backlight function

■ **Scanning function**

Your two-way radio finds out whether there is voice activity in the current channel/contacts group by scanning the channel/contacts group sequence in the list. Your two-way radio can support up to 128 channels in the scanning list. You can add or delete channels by editing the scanning lists with the frequency writing software.

There are three optional scanning recovery modes for the two-way radio. Execute the operation steps below:

1) Access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key (or enter 15 directly) until SC-REV appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key until the pointer on the screen points to TO; then set the scanning mode to "time scanning mode" by pressing [MENU] key, this continue the scanning 5 seconds after finding the signal.
   • or: the pointer on the screen points to CO; then set the scanning mode as "carrier scanning mode" by pressing [MENU] key. After the signal is found, the scanning will continue.

   • or: the pointer on the screen points to SE; then set the scanning mode as "search scanning mode" by pressing [MENU] key. After the signal is found, the scanning will stop.

4) Return to the previous menu.
• **Start and stop scanning**

Execute the operation steps below:

1) Start scanning by pressing [*SCAN] key.  
• or: When scanning, your two-way radio stops in the channel/contacts group where activity is detected. The two-way radio stops in the channel for the preset time which is called "idle time". You can press the [PTT] key and then speak to the microphone clearly.

2) Answer a call on the scanned channel by releasing [PTT] key.

3) If you fail to make a response within the idle time, the two-way radio will go back and scan other channels/contacts groups.

4) You can stop the scanning by pressing any key during scanning.

• **Channel deletion**

You might want to delete certain storage channels. To do this, execute the operation steps below:

1) In analog channel, access the menu by pressing [MENU] key.

2) Press [▲] key or [▼] key (or enter 24 directly) until DELCH appears on the screen; enter this option by pressing [MENU] key.

3) Press [▲] key or [▼] key to select the channel to be deleted. If:  
• The screen shows “CH” and channel number (such as CH-000), that means that the channel number has previously stored channel parameters and can be deleted.

• The screen only shows the channel number (such as 000) but there isn’t the “CH”, that represents that the channel number is blank, needn’t be deleted, and can be stored directly.

4) Then delete the channel by pressing [MENU] key; return to the previous menu.

• **Channel storage**

Parameters that should be contained in a complete channel include receiving frequency, transmitting frequency, receiving CTCSS, transmitting CTCSS, channel bandwidth, busy channel lockout, scan channel adding, and channel name, etc. Scan channel adding and channel name need to be edited with frequency writing software, but all other parameters can be set in frequency mode and stored in specified channel number by entering Menu 23 channel storage. For example, it is required that the following channel storage parameters be stored in Channel Number 001.

1) Receiving frequency 440.5 MHZ  
2) Transmitting frequency 430.5 MHZ  
3) Receiving CTCSS number D031N  
4) Transmitting CTCSS number D031N  
5) Transmitting power high  
6) Channel bandwidth wideband  
7) Join scanning queue

• **Execute the operation steps below:**

1) Select analog channel, switch to VFO mode by pressing [VFO/MR] key, 440.598  
   and splayed on the screen.

2) In frequency mode, make A/B frequency pointer points to A (uplink frequency point) by pressing [A/B] key.

3) Make the two-way radio operate in UHF band by pressing [BAND] key.

4) Adjust the frequency to 440.500MHZ by pressing numeric keys 4,4,0,5,0,0 in turn. 440.500  
   446.200  
   is displayed on the screen.

5) Power setting: Select power (HIGH/LOW) as HIGH by pressing [MENU] →2→ [MENU]→ [▲] or [▼], then return to the menu → [MENU].

6) Bandwidth setting: Select channel bandwidth (NARR/WIDE) as WIDE by pressing 5→ [MENU]→ [▲] or [▼], then return to the menu → [MENU].

7) DCS receiving setting: Select CTCSS value D031N by pressing 10→ [MENU]→ [▲] or [▼], then return to the menu → [MENU],  
   • After received DCS is set, the CTCSS receiving is turned off automatically; in the same way, after received CTCSS is set, the received DCS is turned off automatically. If it is needed to set CTCSS: Select CTCSS value by pressing [MENU]→11→[MENU]→ [▲] or [▼], then return to the menu → [MENU].

8) DCS transmitting setting: Select CTCSS value D031N by pressing 12→ [MENU]→ [▲] or [▼], then return to the menu → [MENU],  
   • After transmitted DCS is set, the transmitted CTCSS is turned off automatically; in the same way, after transmitted CTCSS is set, the DCS transmitting is turned off automatically. If it is needed to set CTCSS: Select CTCSS value by pressing [MENU]→13→[MENU]→ [▲] or [▼], then return to the menu → [MENU],  
   • The CTCSS can be entered through keyboard directly in which case both of standard CTCSS and non-standard CTCSS can be selected, or set by [▲] or [▼] key in which case only standard CTCSS can be selected.

9) Storage setting for the receiving and transmitting of channels in the same frequency:  
9.1) By pressing 23, the screen shows and the pointer points to
MEMCH, the screen shows *MEMCH #1 CH-0001.

9.2) By pressing [MENU] key, voice prompt "store channel" is issued and the screen shows *MEMCH #1 CH-0001.

9.3) By pressing [ ▲ ] key or [ ▼ ] key, select forward or backward the idle channel, and the screen shows.

9.4) By pressing [MENU] key, voice prompt "receiving storage" is issued, and the screen shows.

9.5) By pressing [MENU] key, voice prompt "transmitting storage" is issued, and the screen shows.

9.6) By pressing [EXIT] key, return to frequency mode.

- If it is needed to set relay function, storage setting for the receiving and transmitting of channels in different frequencies
  10.1) By pressing [MENU] → 23, the screen shows.
  10.2) By pressing [MENU] key, voice prompt "store channel" is issued and the screen shows.
  10.3) By pressing [ ▲ ] key or [ ▼ ] key, select forward or backward the idle channel, and the screen shows.
  10.4) By pressing [MENU] key, voice prompt "receiving storage" is issued, and the screen shows.
  10.5) By pressing [EXIT] key, return to frequency mode.
  10.6) Execute Step 4), enter desired transmitting frequency;
  10.7) By pressing [MENU] → 27, the screen shows.
  10.8) By pressing [MENU] key, voice prompt "store channel" is issued, and the screen shows.
  10.9) By pressing [MENU] key, voice prompt "transmitting storage" is issued, and the screen shows.
  10.10) By pressing [EXIT] key, return to frequency mode.

- CTCSS scanning

Before setting CTCSS scanning, set the receiving frequency, ensure that signals can be received at such receiving frequency, and meanwhile cancel dual-frequency waiting function, as well as make the two-way radio operate in frequency mode.

1) DCS scanning
  1.1) Enter correct receiving frequency via the numeric keys.
  1.2) By pressing [MENU] key, enter function menu setting after voice prompt "menu setting" is issued;
  1.3) By pressing [ ▲ ] key or [ ▼ ] key, select forward or backward the Menu 10; or enter number 10 directly to enter Menu 10, the screen shows.
  1.4) By pressing [MENU] key, voice prompt "DCS" is issued; by pressing [*SCAN] key, the screen shows.

- DCS sign flashing represents that the two-way radio has enter DCS scanning state; the numbers of the DCS will not move when there isn't signal;
- After receiving signals, the numbers of the DCS move rapidly in turn according to sequence of standard CTCSS. When the two-way radio finds that the CTCSS in the receiving signals is consistent with one group standard DCS, the two-way radio will issue a "beep" prompt tone, and scanning stops.
- If you want to store this CTCSS scanned, press [MENU] key to store it, otherwise press [EXIT] key to exit.

2) CTCSS scanning.
  2.1) Enter correct receiving frequency via the numeric keys
  2.2) By pressing [MENU] key, enter function menu setting after voice prompt "menu setting" is issued
  2.3) By pressing [ ▲ ] key or [ ▼ ] key, select forward or backward the Menu 11; or enter number 11 directly to enter Menu 11, the screen shows.

  2.4) By pressing [MENU] key, voice prompt "CTCSS" is issued; by pressing [*SCAN] key, the screen shows.
- CT sign flashing represents that the two-way radio has enter CTCSS scanning state; the numbers of the CTCSS will not move when there isn't signal;
- After receiving signals, the numbers of the CTCSS move rapidly in turn according to sequence of standard CTCSS. When the two-way radio finds that the CTCSS in the receiving signals is consistent with one group standard CTCSS, the two-way radio will issue a "beep" prompt tone, and scanning stops.
- If you want to store this CTCSS scanned, press [MENU] key to store it, otherwise press [EXIT] key to exit.

- Relay echo (relay acknowledgement tone)

Relay echo means that the relay station is in transmitting state for a little short time after the handset of the transmitter enters receiving state, due to the relay station’s delay in its judgment on the loss of carrier signals transmitted by the transmitter’s handset when the signal transmitted by the handset is retransmitted by the relay station. Some HAMs just utilize this little short time to judge whether the relay station has retransmitted our signal.

Via the setting of Menu 30, 31 and 32, this residual signal of the relay station can be caught accurately when returning to receiving state so as to acknowledge whether our signal has been retransmitted by the relay station.

To do this, Menu 30 and Menu 31 must be set as OFF, and Menu 32 may do the selection between 1 and 10 which can be set as 5 based on the empirical value.

- Sound and light alarm/alarm cancellation

In analog mode, enter emergency alarm state by long pressing the alarm function key [CALL]; the system issues alarm sound continuously, and the bright light flashes at the same time; after pressing the alarm function key [CALL], the system exits from emergency alarm state and stops issuing the alarm sound.
Digital function operation

Digital mode (DMR system) of this two-way radio is compatible with analog mode; when digital channel is set, the screen shows \[ 
\text{Digital} \quad \begin{array}{c} \text{Channel} \quad \text{TX Frequency} \\ \hline \text{D023} \quad \text{D025} \quad \text{D026} \quad \text{D031} \quad \text{D032} \quad \text{D036} \quad \text{D043} \quad \text{D047} \quad \text{D051} \quad \text{D053} \quad \text{D054} \quad \text{D065} \quad \text{D071} \quad \text{D072} \quad \text{D073} \quad \text{D074} \\

\end{array} \right] 
\text{, i.e., D icon is displayed in the first line of the screen. Digital mode doesn't support certain analog menus, i.e., in digital mode, unsupported menus shall be screened and skipped over.}

Some functions of this two-way radio can be programmed manually via the keyboard, but more functions must be programmed via frequency writing software. First, frequency reading must be done when the two-way radio is turned on, parameters and functions can then be modified and edited, and frequency writing and updating of two-way radio setting shall be completed at last.

1. Individual call in digital mode:

First, use the frequency writing software to establish new contact in digital contacts, select call type--voice individual call, and set the call ID as 1 (the range is 1-16776415).

Then, add channel contacts in channel or A1B channel as shown below:
Do the frequency writing last

Make individual call
If you want to receive and/or respond to individual call made by authorized individual two-way radio, you must preset your two-way radio in order to make the individual call.
For example: after execution of transmitting by pressing [PTT] key, you can make call to handset with ID number of 1, and only two-way radio with the ANI-ID number of 1 can receive the call.

2. Group calls in digital mode
First, use the frequency writing software to establish new contact in digital contacts, select call type—voice group call, and set the call ID as 61235 (the range is 1~16776415).

Next, add this contact in the receiving group list, select the Contact 1 in the member list and press "ADD" key to incorporate it into selected members as shown below:

Do the frequency writing at last
Make group call
After execution of transmitting by pressing [PTT] key, you can make call to Group ID 61235, and the receiver can receive the call as long as Group ID 61235 is included in its receiving list.

3. All call in digital mode
This function allows you to transmit signals to all users on the channel.
You must preset your two-way radio so as to allow you to use the function. Setting steps are as follows:
First, use the frequency writing software to establish new contact in digital contacts, select call type—voice all call, and set the call ID as 18777215. As shown in the figure below:
Then, add channel contacts in channel or A/B channel as shown below:

4. Contacts setting in digital mode:
All contacts shall be established and written via frequency writing software, then current channel contact can be selected via Menu 31, i.e., select the ID to be called by pressing [PTT].

5. Voice encryption in digital mode
Set key value in encryption options of DMR service via frequency writing software (note that the key should be comprised of several different characters, otherwise the encryption will be poor) as shown below:

Then, select encryption key in channel or A/B channel as shown below:

Do the frequency writing last

Make full call: After execution of transmitting by pressing [PTT] key, you can make call to all two-way radios in the same frequency.

Do the frequency writing last and show that the current channel has gone through encryption setting, only two-way radios having the same key can communicate, otherwise communication can't be achieved; the encryption options can also be changed via Menu 33.
6. Emergency alarm in digital mode:
First, use the frequency writing software to open the alarm interface as shown below:

Then, select alarm system in channel or \( \text{A} \& \text{B} \) channel as shown below:

Do the frequency writing last

In digital mode, the emergency alarm can be transmitted by long pressing the side key (CALL key). If the receiver doesn't tick the alarm prompt, alarm acknowledgement and call prompt, no reflection with respect to the alarm will be given; the transmitter can cancel emergency alarm actively, and the receiver can remove the alarm sound by pressing PTT key, but can't exit from the emergency alarm state actively unless resetting the two-way radio.
• Two-way radio detection (available in digital mode)

If it is activated, the function can help you confirm whether there are other two-way radios in the system that are activated, without disturbing two-way radio users. No voice or visual notices are sent to target two-way radio. The function is only applicable to user nickname or ID.

Two-way radio detection transmitting

Execute the operation steps below:
1) Access the menu by pressing [MENU] key.
2) Press [▲] key or [▼] key (or enter 31 directly) until CONTCT appears on the screen; enter this option by pressing [MENU] key.
3) Press [▲] key or [▼] key until the pointer on the screen points to P 1; then set as individual call P by pressing [MENU] key (note: Group call G and all call ALLCALL don't support two-way radio detection function)
4) Return to the previous menu.
5) Start two-way radio detection by long pressing [MONI] key. For example: ID of main two-way radio is 1 and ID of two-way radio detected is 2; "Beep" in long low pitch sounding after the [MONI] key is pressed represents "detection failed" (radio B is offline or current communication environment is so poor that the detection can't be completed successfully). "Beep" in high pitch sounding after the [MONI] key is pressed represents "detection successful" (radio B is online).

• Digital channel storage

Parameters that should be contained in a complete channel include receiving frequency, transmitting frequency, channel contacts, color code, transmitting power, time slot, encryption, scan channel adding, and channel name, etc. “Scan channel adding” and “channel name” need to be edited with frequency writing software, all other parameters can be set in frequency mode and stored in specified channel number by Menu 19 channel storage.

For example, it is required that the following digital channel parameters shall be stored in Channel Number 001.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiving frequency</td>
<td>454.325 MHZ</td>
</tr>
<tr>
<td>Transmitting frequency</td>
<td>460.325 MHZ</td>
</tr>
<tr>
<td>Channel contacts</td>
<td>Selection</td>
</tr>
<tr>
<td>Color code</td>
<td>1</td>
</tr>
<tr>
<td>Transmitting power</td>
<td>High</td>
</tr>
<tr>
<td>Time slot</td>
<td>Slot1</td>
</tr>
<tr>
<td>Encryption</td>
<td>Off</td>
</tr>
<tr>
<td>Join scanning queue</td>
<td>Write in frequency writing software as necessary</td>
</tr>
</tbody>
</table>

Operation steps for deletion of digital channel
1) In digital channel mode, access the menu by pressing [MENU] key.
2) Press [▲] key or [▼] key (or enter 20 directly) until DELCH appears on the screen; enter this option by pressing [MENU] key.
3) Press [▲] key or [▼] key until the pointer on the screen pointing to CH-001, representing that Channel 001 has previously stored channel parameters and can be deleted.
4) If only 001 is displayed (CH character isn't displayed), that represents that Channel 001 doesn't have channel parameters, needn't be deleted, and can be stored directly.
5) Then delete the channel by pressing [MENU] key and the channel becomes an idle channel (Only channel number is displayed, CH character isn't displayed).

Operation steps for storage of digital channel
1) Select digital channel (pay attention to Symbol D), switch to frequency mode by pressing [VFO/MR] key, is displayed on the screen.
2) In frequency mode, make A/B frequency pointer points to A (uplink frequency point) by pressing [A/B] key.
3) Make the two-way radio operate in UHF band by pressing [BAND] key;
4) Adjust the frequency to 454.325MHZ by pressing numeric keys 4,5,4,3,2,5 in turn, is displayed on the screen.
5) Power setting: Select transmitting power TXP as HIGH by pressing [MENU]→2→[MENU]→[▲] or [▼], then return to the menu → [MENU];
6) Channel contacts setting: Select channel contacts CONTCT as G by pressing →31→[MENU]→[▲] or [▼], then return to the menu → [MENU];
7) Color code setting: Select color code CC as 1 by pressing 32→[MENU]→[▲] or [▼], then return to the menu → [MENU];
8) Encryption setting: Select encryption ENC-KEY as OFF by pressing 33→[MENU]→[▲] or [▼], then return to the menu → [MENU];
9) Time slot setting: Select time slot BS-SLOT as SLOT1 by pressing 34→[MENU]→[▲] or [▼], then return to the menu → [MENU];
10) Frequency difference direction setting: Select frequency difference direction SFT-D as + by pressing 17→[MENU]→[▲] or [▼], then return to the menu → [MENU];

Note: The frequency difference direction in this example is +. ++ means that transmitting frequency is the receiving frequency plus frequency difference; •• means that transmitting frequency is the receiving frequency plus frequency difference; OFF means off. In frequency mode, there isn't difference between transmitting frequency and receiving frequency.
11) Frequency difference setting: Press 18→[MENU]→voice prompt “frequency difference” and screen display OFFSET→press numeric keys to enter 006000→[MENU].
Note: The frequency different in this example is 006.000MHZ. It shall be set according to the actual situation of the relay station.

12) Channel storage
12.1) Access the menu by pressing [MENU] key
12.2) Press [▲] key or [▼] key (or enter 19 directly) until MEMCH appears on the screen; enter this option by pressing [MENU] key. Voice prompt “store channel” is issued.
12.3) Press [▲] key or [▼] key to select forward or backward Channel 001 (or idle channel).
12.4) Then press [MENU] key to confirm channel storage, and now CH-001 is displayed at the position of channel number.
By the above settings, press [FVO/MR] key to switch to channel mode, enter 1 directly, and now you can find that there are channel parameters on channel number 001. You can also decide the display mode of channel parameters via Menu 13 and Menu 14. Menu 13 decides the channel display mode of uplink channel; Menu 14 decides the channel display mode of downlink channel.
•FREQ means frequency mode;
•CH means channel mode;
•NAME means channel number and channel name and mode.

Menu operation
• What is menu?
For this two-way radio, many functions can be selected and configured via menu controlled by software rather than physical control components of the two-way radio. Once you become familiar with the menu system, its various functions will make you feel convenient. You can customize various setting and programming functions for this two-way radio as needed to avoid frequent use of keys, control buttons and switches.

• Access to menu and menu operation (operation in standby mode)
1) Press [MENU] key to enter function menu setting, "menu setting" voice prompt is issued, and the screen shows
2) Press [▲] key or [▼] key to select forward (rising prompt tune) or backward (falling prompt tune) the desired menu number, or enter into the desired menu number by or entering a number according to the sequence number of the menu.
3) When changing menu number, the display screen will show a short description of each menu and current parameters.
4) Press [▲] key or [▼] key to select forward or backward the desired parameters;
5) Confirm by pressing [MENU] key, voice prompt "confirm" is issued, save and return to previous menu;
6) Cancel the save action and exit from the menu mode by pressing [EXIT] key, return to main interface.

• Rapid menu search function
After entering into menu selection or function parameter selection under menu items by pressing [MENU] key, search upward or downward the menu and various parameters by pressing [▲] key or [▼] key once, or search rapidly upward or downward by pressing and holding the [▲] key or [▼] key.
Setting of following menu items are unavailable in channel mode: CTCSS, DCS, wideband/narrowband, BCL, scan channel adding, signaling code and channel name. In current channel mode, high/low power can be switched rapidly via [#/#] key only.

• Menu information list
DMR of this two-way radio is compatible with FM analog. The menu is divided into analog menu and DMR digital menu.
FM analog menus shall be accessed and operated in analog channel, as detailed below:

<table>
<thead>
<tr>
<th>Menu number</th>
<th>Display character</th>
<th>Function description</th>
<th>Display character of secondary menu</th>
<th>Instructions for setting of secondary menu</th>
</tr>
</thead>
<tbody>

Note: MSG, CP Ver. doesn’t support modification; ANI-ID needs to be modified via frequency writing software.

Auxiliary functions

• Restore factory settings

In case of a failure of this two-way radio due to operation or setting error, resetting the microprocessor may solve the problem. This function operation can be used to restore all settings and channels of this two-way radio to factory state. Memory data and stored information may be lost during the resetting process. Before resetting, please back up or write down important data.

• All reset

Execute the operation steps below:
1) Access the menu by pressing [MENU] key.
2) Press [▲] key or [▼] key (or enter 28 directly) until RESET appears on the screen; enter this option by pressing [MENU] key.
3) Press [▲] key or [▼] key until the pointer on the screen points to ALL: then execute all reset operation by pressing [MENU] key.
4) During operation, go back and exit from the menu mode by pressing [EXIT] key. By resetting, data shall be deleted and factory settings of the two-way radio shall be restored, therefore, this function shall be used prudently.

• VFO reset

"VFO reset" means resetting two-way radio parameters except DTMF memory, memory channel content and call channel content. Execute the operation steps below:
1) Access the menu by pressing [MENU] key.
2) Press [▲] key or [▼] key (or enter 28 directly) until RESET appears on the screen; enter this option by pressing [MENU] key.
3) Press [▲] key or [▼] key until the pointer on the screen points to VFO; then execute VFO reset by pressing [MENU] key.

4) The screen shows WAIT… until the two-way radio is reset.
   ▲ During operation, go back and exit from the menu mode by pressing [EXIT] key. By resetting, data shall be deleted and factory settings of the two-way radio shall be restored, therefore, this function shall be used prudently.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Without power supply, the two-way radio doesn’t work.</td>
<td>The battery may have run out. Please replace or charge the battery</td>
</tr>
<tr>
<td></td>
<td>The battery may be installed improperly. Please remove and reinstall the battery once.</td>
</tr>
<tr>
<td>The battery runs out again not long after charging.</td>
<td>The battery has reached its service life limit (about 300 charging and discharging cycles), please replace the battery.</td>
</tr>
<tr>
<td>The two-way radio can’t make call to other members in the group.</td>
<td>Please confirm whether frequency and CTCSS signal tone are consistent with that of other members in the group.</td>
</tr>
<tr>
<td></td>
<td>Other members in the group may be too far away. Please confirm whether you are within the valid range of other two-way radios.</td>
</tr>
<tr>
<td>Digital channel can’t achieve individual call or group call</td>
<td>If the two-way radio can’t make normal calls in digital mode, please check whether the color code, contact and receiving group address are abnormal. Investigate in accordance with Point 1 and Point 2 of the digital operation instructions.</td>
</tr>
<tr>
<td>Communication distance is short.</td>
<td>Confirm whether the antenna is in good contact and is the original antenna, and whether the battery voltage is normal. The dealer adjusts the squelch level.</td>
</tr>
<tr>
<td>Other tones (not from group members) appear in the channel.</td>
<td>Please change the CTCSS signal tone. At this time, be sure to change the signal tone of all two-way radios in the group.</td>
</tr>
<tr>
<td>Noise level is high.</td>
<td>The two-way radio is too far away from other members. After adjusting the valid communication range, reset the two-way radio and try again.</td>
</tr>
<tr>
<td></td>
<td>The two-way radio is in a bad location such as in a place that is blocked by a high building or in basement. After transferring the two-way radio to a flat and open place, reset it and try again.</td>
</tr>
<tr>
<td></td>
<td>The two-way radio is interrupted by external environment or electromagnetic field. Keep the two-way radio away from equipments which may interrupt it.</td>
</tr>
</tbody>
</table>

▲ If the methods above fail to solve your problems or you meet some other failures, please contact local dealer for more technical support.

• Maintenance and cleaning

To ensure that this two-way radio exerts its excellent performance, thereby extending its service life, please familiarize yourself with the content below and conduct daily maintenance and cleaning better.

• Maintenance

◆ Don’t put the two-way radio in an environment with substances that may erode electronic circuits;
◆ During carrying or using the two-way radio, don’t hold the antenna or external microphone directly with hands;
◆ When the accessories are not used, close the accessory interface cover properly.
• Cleaning

◆ Please remove the dust adhered on the surface of the two-way radio and the charging pole with clean and dry lint free cloth or brush.
◆ Wipe the dust and dirt on the two-way radio with lint free cloth to avoid bad contact;
◆ After the two-way radio has been used for a long term, its keys, control knob and shell get dirty easily. Neutral detergent (rather than highly corrosive chemical agent) and wet cloth may be used to clean them. After cleaning, be sure that the two-way radio are thoroughly dry, otherwise it shall not be used.
◆ When the two-way radio isn’t used, close the cover of accessory jack; Please turn off the two-way radio and take the battery out before you clean the two-way radio.
